

NAME

Padre::Config::Host – Padre configuration storing host state data

DESCRIPTION

This class implements the state data of the host on which Padre is running. See Padre::Config for more information on the various types of preferences supported by Padre.

All those state data are stored in a database managed with Padre::DB. Refer to this module for more information on how this works.

PUBLIC API**Constructors**

read

```
my $config = Padre::Config::Host->read;
```

Load & return the host configuration from the database. Return undef in case of failure.

No parameters.

Object methods

version

```
my $revision = $config->version;
```

Return the configuration schema revision. Indeed, we might want to change the underlying storage later on.

No parameters.

write

```
$config->write;
```

(Over-)write host configuration to the database.

No parameters.
