User Contributed Perl Documentation

Padre::Config::Human(3pm)

NAME

Padre::Config::Human – Padre configuration storing personal preferences

DESCRIPTION

This class implements the personal preferences of Padre's users. See Padre::Config for more information on the various types of preferences supported by Padre.

All human settings are stored in a hash as top-level keys (no hierarchy). The hash is then dumped in *config.yml*, a YAML file in Padre's preferences directory (see Padre::Config).

PUBLIC API**Constructors**

create

```
my $config = Padre::Config::Human->create;
```

Create and return an empty user configuration. (Almost empty, since it will still store the configuration schema revision – see “version”).

No parameters.

read

```
my $config = Padre::Config::Human->read;
```

Load & return the user configuration from the YAML file. Return undef in case of failure.

No parameters.

Object methods

version

```
my $revision = $config->version;
```

Return the configuration schema revision. Indeed, we might want to have more structured configuration instead of a plain hash later on. Note that this version is stored with the other user preferences at the same level.

No parameters.

write

```
$config->write;
```

(Over-)write user configuration to the YAML file.

No parameters.
