

**NAME**

Padre::PluginBuilder – Module::Build subclass for building Padre plug-ins

**DESCRIPTION**

This is a Module::Build subclass that can be used in place of Module::Build for the Build.PL of Padre plug-ins. It adds two new build targets for the plug-ins:

**ADDITIONAL BUILD TARGETS****plugin**

Generates a *.par* file that contains all the plug-in code. The name of the file will be according to the plug-in class name: Padre::Plugin::Foo will result in *Foo.par*.

Installing the plug-in (for the current architecture) will be as simple as copying the generated *.par* file into the `plugins` directory of the user's Padre configuration directory (which defaults to `~/padre` on Unix systems).

**installplugin**

Generates the plug-in *.par* file as the `plugin` target, but also installs it into the user's Padre plug-ins directory.
