

FFTEngine(3)

QuantLib

FFTEngine(3)

**NAME**

FFTEngine – Base class for FFT pricing engines for European vanilla options.

**SYNOPSIS**

```
#include <ql/experimental/variancegamma/fftengine.hpp>
```

Inherits engine.

Inherited by **FFTVanillaEngine**, and **FFTVarianceGammaEngine**.

**Public Member Functions**

```
FFTEngine (const boost::shared_ptr<StochasticProcess1D> &process, Real logStrikeSpacing)
void calculate () const
void update ()
void precalculate (const std::vector< boost::shared_ptr<Instrument> >&optionList)
virtual std::auto_ptr<FFTEngine> clone () const =0
```

**Protected Member Functions**

```
virtual void precalculateExpiry (Date d)=0
virtual std::complex<Real> complexFourierTransform (std::complex<Real> u) const =0
virtual Real discountFactor (Date d) const =0
virtual Real dividendYield (Date d) const =0
void calculateUncached (boost::shared_ptr<StrikedTypePayoff> payoff, boost::shared_ptr<
Exercise> exercise) const
```

**Protected Attributes**

```
boost::shared_ptr<StochasticProcess1D> process_
Real lambda_
```

**Detailed Description**

Base class for FFT pricing engines for European vanilla options.

The FFT engine calculates the values of all options with the same expiry at the same time. For that reason it is very inefficient to price options individually. When using this engine you should collect all the options you wish to price in a list and call the engine's precalculate method before calling the NPV method of the option.
