

**NAME**

Net::DPAP::Client – Connect to iPhoto shares (DPAP)

**SYNOPSIS**

```
use Net::DPAP::Client;
my $client = Net::DPAP::Client->new;
$client->hostname($hostname);
my @albums = $client->connect;

foreach my $album (@albums) {
    print $album->name, "\n";
    foreach my $image (@{$album->images}) {
        print "    ", $image->name, "\n";
        my $thumbnail = $image->thumbnail;
        my $hires = $image->hires;
    }
}
```

**DESCRIPTION**

This module provides a DPAP client. DPAP is the Digital Photo Access Protocol and is the protocol that Apple iPhoto uses to share photos. This allows you to browse shared albums, and download thumbnail and hires versions of shared photos.

It currently doesn't support password-protected shares.

**METHODS****new**

The constructor:

```
my $client = Net::DPAP::Client->new;
$client->hostname($hostname);
```

**connect**

Connect to the hostname:

```
my @albums = $client->connect;
```

**SEE ALSO**

Net::DPAP::Client::Album, Net::DPAP::Client::Image.
