

NAME

Net::Domain – Attempt to evaluate the current host's internet name and domain

SYNOPSIS

```
use Net::Domain qw(hostname hostfqdn hostdomain domainname);
```

DESCRIPTION

Using various methods **attempt** to find the Fully Qualified Domain Name (FQDN) of the current host. From this determine the host-name and the host-domain.

Each of the functions will return *undef* if the FQDN cannot be determined.

`hostfqdn ()`

Identify and return the FQDN of the current host.

`domainname ()`

An alias for `hostfqdn ()`.

`hostname ()`

Returns the smallest part of the FQDN which can be used to identify the host.

`hostdomain ()`

Returns the remainder of the FQDN after the *hostname* has been removed.
