MIME::Decoder::QuotedPrint(3pm) User Contributed Perl Documentation MIME::Decoder::QuotedPrint(3pm)

NAME

MIME::Decoder::QuotedPrint – encode/decode a "quoted–printable" stream

SYNOPSIS

A generic decoder object; see MIME::Decoder for usage.

DESCRIPTION

A MIME::Decoder subclass for the `"quoted-printable"` encoding. The name was chosen to jibe with the pre-existing MIME::QuotedPrint utility package, which this class actually uses to translate each line.

- The **decoder** does a line-by-line translation from input to output.

- The **encoder** does a line-by-line translation, breaking lines so that they fall under the standard 76–character limit for this encoding.

Note: just like MIME::QuotedPrint, we currently use the native `"\n"` for line breaks, and not `CRLF`. This may need to change in future versions.
