

MojoMojo::Schema::Result::PageVersion(3pm) contributed Perl Documentation

## NAME

MojoMojo::Schema::Result::PageVersion – Versioned page metadata

## DESCRIPTION

This table implements versioning of page metadata (not content, see MojoMojo::Schema::Result::Content for that). It has a composite primary key (`page`, `version`).

When renaming a page, a new version is created in this table, with `version` set to `1 + the maximum version for that page`. The `status` of the new `page_version` is set to “released”, its `release_date` is set to `DateTime->now`, while the old `page_version`’s status is set to ‘removed’ and its `remove_date` is set to `DateTime->now`.

## TODO

- document the relationships
- in order to support proper rollback, meaning creating a new version for the rollback operation itself, a `content_version` field needs to be added.
- `created` is apparently unused: set to 0 for pages populated when creating the database, and NULL for all normal pages.

## METHODS

### latest\_version

Return the `PageVersion` object having the latest version of this page.
