

NAME

MooseX::InsideOut – inside–out objects with Moose

VERSION

version 0.106

SYNOPSIS

```
package My::Object;

use MooseX::InsideOut;

# ... normal Moose functionality
# or ...

package My::Subclass;

use MooseX::InsideOut;
extends 'Some::Other::Class';
```

DESCRIPTION

MooseX::InsideOut provides metaroles for inside-out objects. That is, it sets up attribute slot storage somewhere other than inside `$self`. This means that you can extend non-Moose classes, whose internals you either don't want to care about or aren't hash-based.

METHODS**init_meta**

Apply the instance metarole necessary for inside-out storage.

TODO

- dumping (for debugging purposes)
- serialization (for e.g. storable)
- (your suggestions here)
