

**NAME**

**mkd\_line** — do Markdown translation of small items

**LIBRARY**

Markdown ( libmarkdown, -lmarkdown )

**SYNOPSIS**

```
#include <mkdio.h>

int
mkd_line(char *string, int size, char **doc, int flags);

int
mkd_generateline(char *string, int size, FILE *output, int flags);
```

**DESCRIPTION**

Occasionally one might want to do markdown translations on fragments of data, like the title of an weblog article, a date, or a simple signature line. **mkd\_line** and **mkd\_generateline** allow you to do markdown translations on small blocks of text. **mkd\_line** allocates a buffer, then writes the translated text into that buffer, and **mkd\_generateline** writes the output to the specified *FILE*\*.

**SEE ALSO**

[markdown\(1\)](#), [markdown\(3\)](#), [markdown\(7\)](#), [mkd-extensions\(7\)](#), [mmap\(2\)](#).

**BUGS**

Error handling is minimal at best.
