

NAME

smiGetAttribute, **smiGetFirstAttribute**, **smiGetNextAttribute**, **smiGetAttributeParentClass**, **smiGetAttributeParentType**, **smiGetFirstUniqueAttribute**, **smiGetNextUniqueAttribute**, **smiGetEvent**, **smiGetFirstEvent**, **smiGetNextEvent**, **smiGetAttributeFirstRange**, **smiGetAttributeNextRange**, **smiGetAttributeFirstNamedNumber**, **smiGetAttributeNextNamedNumber** – SMI Attribute information routines

SYNOPSIS

```
#include <smi.h>
```

```
SmiAttribute *smiGetAttribute(SmiClass *smiClassPtr, char *name);

SmiAttribute *smiGetFirstAttribute(SmiClass *smiClassPtr);

SmiAttribute *smiGetNextAttribute(SmiAttribute *smiAttributePtr);

SmiType *smiGetAttributeParentType(SmiType *smiAttributePtr);

SmiClass *smiGetAttributeParentClass(SmiType *smiAttributePtr);

SmiAttribute *smiGetFirstUniqueAttribute(SmiClass *smiClassPtr);

SmiAttribute *smiGetNextUniqueAttribute(SmiAttribute *smiAttributePtr);

SmiRange *smiGetAttributeFirstRange(SmiAttribute *smiAttributePtr);

SmiRange *smiGetAttributeNextRange(SmiRange *smiRangePtr);

SmiNamedNumber *smiGetAttributeFirstNamedNumber(SmiAttribute *smiAttributePtr);

SmiNamedNumber *smiGetAttributeNextNamedNumber(SmiNamedNumber *smiNamedNumberPtr);

typedef struct SmiAttribute {
    SmiIdentifier    name;
    SmiDecl         decl;
    SmiStatus       status;
    char            *description;
    char            *reference;
} SmiAttribute;

typedef struct SmiRange {
    SmiValue        minValue;
    SmiValue        maxValue;
} SmiRange;

typedef struct SmiNamedNumber {
    SmiIdentifier   name;
    SmiValue        value;
} SmiNamedNumber;
```

DESCRIPTION

These functions retrieve information on a SMIg Attribute definition (SMIg).

smiGetAttribute(SmiClass *smiClassPtr, char *name) returns a pointer to **struct SmiAttribute** for the Attribute with the given *name* in the given class(*smiClassPtr*), or NULL if the attribute with the given name does not exist.

smiGetFirstAttribute(SmiClass *smiClassPtr) and **smiGetNextAttribute(SmiAttribute *smiAttributePtr)** are used to iterate through the attributes of the class given by *smiClassPtr*. They return a pointer to **struct SmiAttribute** that represents an attribute or NULL if there are no attributes left in the

class, or error has occurred.

smiGetAttributeParentClass(SmiAttribute *smiAttributePtr) returns a pointer to a **struct SmiClass**, pointing to the parent class of the given *smiAttributePtr*, or NULL if the attribute does not reference class. Note that attributes always have either parent type or parent class.

smiGetAttributeParentType(SmiType *smiAttributePtr) returns a pointer to a **struct SmiType**, pointing to the parent type of the given *smiAttributePtr*, or NULL if the attribute does not reference type. Note that attributes always have either parent type or parent class.

smiGetFirstUniqueAttribute(SmiClass *smiClassPtr) and **smiGetNextUniqueAttribute(SmiType *smiAttributePtr)** are used to iterate through the unique attributes of the class given by *smiClassPtr*. They return a pointer to **struct SmiAttribute** that represents a unique attribute or NULL if there are no unique attributes left in the class, or error has occurred. This function **MUST NOT** be used for scalar classes, so it should only be called after **isClassScalar()** has returned 0.

smiGetAttributeFirstRange(SmiAttribute *smiAttributePtr), and **smiGetAttributeNextRange(SmiRange *smiRangePtr)** are used to iterate through ranges that restrict number or octet string types. Both functions return a pointer to the **struct SmiRange** representing the range, or NULL if there are no more ranges, or error has occurred.

smiGetAttributeFirstNamedNumber(SmiAttribute *smiAttributePtr) and **smiGetAttributeNextNamedNumber(SmiNamedNumber *smiNamedNumberPtr)** are used to iterate through named numbers of bits or enumerations for attributes, which reference types, and to retrieve the reference restriction of a pointer. Both functions return a pointer to the **struct SmiNamedNumber** representing the named number, or NULL if there are no named numbers left, or error has occurred. **smiGetFirstNamedNumber()** can be used to retrieve the name of the identity that is restricting Pointer type, as it is stored as the name of the first named number.
